

Newt, the third prototype

R. S. Doiel, rsdoiel@caltech.edu

Caltech Library, Digital Library Development

What is Newt?

- ▶ A rapid application develop tool
 - ▶ for applications that curate metadata
- ▶ Audience: Libraries, Archives, Galleries and Museums

Findings from Prototype 2:

Is Newt and “off the shelf” software enough to create metadata curation applications?

Short answer is **yes**. Longer answer is more nuanced.

Findings from Prototype 2:

Is Newt and “off the shelf” software enough to create metadata curation applications?

1. Newt's YAML file can grow very large
2. Managing the YAML file can be done interactively
3. Model vetting and validation should happen early in the data pipeline
4. Postgres+PostgREST is a complex back end

Questions raised by Prototype 2:

- ▶ Where do I focus my simplification efforts?
- ▶ What is a “good enough” interface for managing the YAML file?
- ▶ Mustache templates language are too simple, what should replace it?

High level Concepts (remain the same)

- ▶ describe the application you want
- ▶ generate the application you described
- ▶ running the application using a service oriented architecture

Implementation Concepts (remaining the same)

- ▶ JSON data sources
- ▶ data modeled in YAML
- ▶ routing requests through data pipelines
- ▶ simple template engine renders JSON as HTML

Themes (remains the same)

- ▶ Pick Simple = (No coding) + (Less coding)
- ▶ Compose applications by combining models with data pipelines
- ▶ Avoid inventing new things

Goal of Prototype 3: Questions to explore

1. Is Handlebars a good fit for managing data views and rendering HTML?
2. Is TypeScript validation middleware the right fit?
3. Should Postgres+PostgREST remain the exclusive back end of Newt?
4. What is the right solution for the messy setup of Postgres+PostgREST?
5. Should the generated TypeScript be compiled?

Changes from last prototype

- ▶ Removed some Go cli (e.g. ws, mustache, newtmustache)
- ▶ The action “init” was renamed “config”, now an optional action
- ▶ The action “generate” was subsumed by “build”
- ▶ Renamed newtrouter to ndr (Newt Data Router)
- ▶ Added nte (Newt Template Engine), a Handlebars template engine

Changes from last prototype

- ▶ “oid” was renamed “identifier”
- ▶ Interactive modeler and configuration simplified
- ▶ Experimenting with Deno+TypeScript validation middleware

Off the shelf (no coding)

- ▶ JSON Data Source
 - ▶ [Postgres](#) + [PostgREST](#)
- ▶ newt, ndr, and nte
- ▶ Deno compiles TypeScript validation middleware

Assemble app from YAML (less coding)

- ▶ Data modeling via a interactive user interface
- ▶ Results is expressed in YAML

How do I think things will work?

1. Model your data interactively
2. Build your application
3. Run and test using Newt command
4. Test with your favorite web browser

Here's the shell commands

```
newt model app.yaml  
newt build app.yaml  
newt run app.yaml  
firefox http://localhost:8010
```

Third prototype status

- ▶ A work in progress (continuing through 2024)
- ▶ Working towards a version 1.0 release in 2025
- ▶ Using parts of Newt internally

How much is built?

- ☒ Newt developer tool
- ☒ Router is implemented and working
- ☒ ~~Mustache template engine is working~~ (removed)
- ☒ Newt template engine (supporting Handlebars templates)
- ☐ Modeler (testing and refinement)
- ☐ Generator development (refactor, testing and refinement)

Out of the box prototype 3

- ▶ `newt` the Newt development tool
- ▶ `ndr` the Newt data router
- ▶ `nre` the Newt Template Engine
- ▶ Depends on Postgres+PostgREST and Deno

What's next?

- ▶ Plan 4th prototype
- ▶ Build real applications with 4th prototype
- ▶ Get feedback for refinement
- ▶ Fix bugs

Lessons from current development

- ▶ “Off the shelf” is simpler
- ▶ An interactive UI is more compelling
- ▶ A simpler “back end” is desirable

Unanswered Questions

- ▶ What is the minimum knowledge needed to use Newt effectively?
- ▶ What is the best human interface for Newt?
- ▶ Who is in the target audience?

Someday, maybe ideas

- ▶ Release v1.0 of Newt
- ▶ A visual programming or conversational user interface
- ▶ Simplified backend (e.g. SQLite3)
- ▶ Web components for library, archive and museum metadata types
- ▶ S3 protocol support for implementing file storage using OCFL
- ▶ Render whole newt app as a standalone binary
